

Bark Verpakkingen

Inliners for Schütz containers

Bark Verpakkingen has developed an inliner for the Schütz IBC which can be fitted inside the container. The inliner is of a high standard of quality and suitable for the following uses:

1. Filling with liquids where the product would dry out, spoil or harden in a standard container (without inliner) due to the effects of air and/or moisture. The fact that emptying the container creates a vacuum in the inliner as the liquid level goes down ensures that no air gets into your product.
2. If you are using the container in a pool system or container deposit system, use of the inliner presents an excellent alternative to rinsing containers. A significant additional benefit is that it eliminates the chances of contamination.
3. Products that can mean the container is difficult to clean after use, such as (for example) inks and lacquers. Using the inliner will prevent this problem and result in a dramatic reduction in terms of your chemical packaging waste. It will even extend the life cycle of the container.
4. Use of the inliner will enable you to empty the container better, as a result of which less (residual) product will be left behind in the container.

The inliners are available in the following specifications:

- 640 & 1000 litre (other volumes on request)
- Single-walled PE
- Double-walled PE
- Barrier using Coex PE/PE, PE/PA
- NW 110 opening for filling
- NW 50 outlet
- Available fitted in IBC
- Available separately
